This is my setup for using GUIDs: PK = GUID. PK Guid is NON-Clustered index. Add ClusterID Int to every table. Joining on ClusterIDs (int) is more efficient, but I work with million record tables, so joining on GUIDs doesn't visibly affect performance. Uniqueness of the row should be enforced using a Unique or Primary Key constraint on the table. NewSequentialID function uses identification number of the computer network card plus a unique number from the CPU clock to generate the uniqueidentifier (Reference article).
